STABILITY OF A GENERALIZED POLYNOMIAL FUNCTIONAL EQUATION OF DEGREE 2 IN NON-ARCHIMEDEAN NORMED SPACES

CHANG-JU LEE* AND YANG-HI LEE**

ABSTRACT. In this paper, we investigate the stability for the functional equation

f(3x+y) - 3f(2x+y) + 3f(x+y) - f(y) = 0

in the sense of M. S. Moslehian and Th. M. Rassias.

1. Introduction

The stability problem of the functional equation was formulated by S. M. Ulam [16] in 1940. D. H. Hyers [4], T. Aoki [1] and Th. M. Rassias [15] made important role to study the stability of the functional equation. During the last decades, the stability problems of functional equations have been extensively investigated by a number of mathematicians, see [2],[3], [6]-[13].

By a non-Archimedean field, we mean a field K equipped with a function (valuation) $|\cdot|$ from K into $[0, \infty)$ such that |r| = 0 if and only if r = 0, |rs| = |r||s|, and $|r + s| \le \max\{|r|, |s|\}$ for all $r, s \in \mathbb{K}$. Clearly |1| = |-1| and $|n| \le 1$ for all $n \in \mathbb{N}$. Let X be a vector space over a scalar field K with a non-Archimedean non-trivial valuation $|\cdot|$. A function $||\cdot|| : X \to \mathbb{R}$ is a non-Archimedean norm (valuation) if it satisfies the following conditions:

- (i) ||x|| = 0 if and only if x = 0;
- (ii) $||rx|| = |r|||x|| \ (r \in \mathbb{K}, x \in X);$

(iii) the strong triangle inequality, namely,

 $||x + y|| \le \max\{||x||, ||y||\}$

for all $x, y \in X$ and $r \in \mathbb{K}$.

Then $(X, \|\cdot\|)$ is called a non-Archimedean normed space. Due to the fact that

$$||x_n - x_m|| \le \max\{||x_{j+1} - x_j|| : m \le j \le n - 1\} (n > m),$$

a sequence $\{x_n\}$ is Cauchy if and only if $\{x_{n+1} - x_n\}$ converges to zero in a non-Archimedean normed space. By a complete non-Archimedean space, we mean one in which every Cauchy sequence is convergent.

Recently M. S. Moslehian and Th. M. Rassias [14] discussed the Hyers-Ulam stability of the Cauchy functional equation f(x+y) = f(x) + f(y) and the quadratic functional equation f(x+y) + f(x-y) - 2f(x) - 2f(y) = 0 in non-Archimedean normed spaces.

Now we consider the generalized polynomial functional equation of degree 2

f(3x + y) - 3f(2x + y) + 3f(x + y) - f(y) = 0

whose solution is called a general quadratic mapping. In 2009, the second author [9] obtained a stability of the generalized polynomial functional equation of degree 2 by taking and composing an additive mapping Aand a quadratic mapping Q to prove the existence of a general quadratic function F which is close to the given function f. In his processing, A is approximate to the odd part $\frac{f(x)-f(-x)}{2}$ of f and Q is close to the even part $\frac{f(x)+f(-x)}{2} - f(0)$ of it, respectively.

In this paper, we get a general stability result of the generalized polynomial functional equation of degree 2 in non-Archimedean normed spaces.

2. Stability of the generalized polynomial functional equation of degree 2

In this section, we prove the generalized Hyers-Ulam stability of the generalized polynomial functional equation of degree 2. Throughout this section, we assume that X is a non-Archimedean normed space and Y is a complete non-Archimedean space.

For a given mapping $f: X \to Y$, we use the abbreviation

$$Df(x,y) := f(3x+y) - 3f(2x+y) + 3f(x+y) - f(y)$$

for all $x, y \in X$.

LEMMA 2.1. (Lemma 3.1 in [5]) If $f : X \to Y$ is a mapping such that Df(x, y) = 0 for all $x, y \in X \setminus \{0\}$, then f is a general quadratic mapping.

THEOREM 2.2. Let $\varphi: (X \setminus \{0\})^2 \to [0,\infty)$ be a function such that

(2.1)
$$\lim_{n \to \infty} \frac{\varphi(2^n x, 2^n y)}{|4|^n} = 0$$

for all $x, y \in X \setminus \{0\}$ and let for each $x \in X \setminus \{0\}$ the limit

(2.2)
$$\lim_{n \to \infty} \max_{0 \le j < n} \left\{ \frac{\varphi(2^{j}x, -2^{j}x)}{|2| \cdot |4|^{j+1}}, \frac{\varphi(-2^{j}x, 2^{j}x)}{|2| \cdot |4|^{j+1}} \right\},$$

denoted by $\tilde{\varphi}(x)$, exists. Suppose that $f: X \to Y$ is a mapping satisfying the inequality

$$||Df(x,y)|| \le \varphi(x,y)$$

for all $x, y \in X \setminus \{0\}$. Then there exists a unique general quadratic mapping $T: X \to Y$ such that

(2.4)
$$||f(x) - T(x)|| \le \tilde{\varphi}(x)$$

for all $x \in X \setminus \{0\}$ with T(0) = f(0). In particular, T is given by

$$T(x) = \lim_{n \to \infty} \frac{f(2^n x) + f(-2^n x) - 2f(0)}{2 \cdot 4^n} + \lim_{n \to \infty} \frac{f(2^n x) - f(-2^n x)}{2^{n+1}} + f(0)$$

for all $x \in X$.

Proof. Let $J_n f: X \to Y$ be a mapping defined by

$$J_n f(x) = \frac{f(2^n x) + f(-2^n x) - 2f(0)}{2 \cdot 4^n} + \frac{f(2^n x) - f(-2^n x)}{2^{n+1}} + f(0)$$

for all $x \in X$ and all $n \in \mathbb{N}$. Notice that $J_0 f(x) = f(x)$ and

Chang-Ju Lee and Yang-Hi Lee

$$\begin{aligned} \|J_{j}f(x) - J_{j+1}f(x)\| &= \left\| -\frac{Df(2^{j}x, -2^{j}x)}{2 \cdot 4^{j+1}} - \frac{Df(-2^{j}x, 2^{j}x)}{2 \cdot 4^{j+1}} \right. \\ &\quad \left. -\frac{Df(2^{j}x, -2^{j}x)}{2^{j+2}} + \frac{Df(-2^{j}x, 2^{j}x)}{2^{j+2}} \right\| \\ &\leq \max\left\{ \frac{\|Df(2^{j}x, -2^{j}x)\|}{|2| \cdot |4|^{j+1}}, \frac{\|Df(-2^{j}x, 2^{j}x)\|}{|2| \cdot |4|^{j+1}}, \frac{\|Df(2^{j}x, -2^{j}x)\|}{|2|^{j+2}}, \frac{\|Df(-2^{j}x, 2^{j}x)\|}{|2|^{j+2}} \right\} \end{aligned}$$

$$(2.5) \qquad \leq \max\left\{ \frac{\varphi(2^{j}x, -2^{j}x)}{|2| \cdot |4|^{j+1}}, \frac{\varphi(-2^{j}x, 2^{j}x)}{|2| \cdot |4|^{j+1}} \right\}$$

for all $x \in X \setminus \{0\}$ and all $j \ge 0$. It follows from (2.5) and (2.1) that the sequence $\{J_n f(x)\}$ is Cauchy for all $x \in X \setminus \{0\}$. Since Y is complete and $J_n f(0) = f(0)$ for all $n \in \mathbb{N}$, we conclude that $\{J_n f(x)\}$ is convergent for all $x \in X$. Set

$$T(x) := \lim_{n \to \infty} J_n f(x).$$

One can show that

$$\begin{aligned} \|J_n f(x) - f(x)\| &= \left\| \sum_{j=0}^{n-1} J_j f(x) - J_{j+1} f(x) \right\| \\ (2.6) &\leq \max_{0 \leq j < n} \left\{ \frac{\varphi(2^j x, -2^j x)}{|2| \cdot |4|^{j+1}}, \frac{\varphi(-2^j x, 2^j x)}{|2| \cdot |4|^{j+1}} \right\} \end{aligned}$$

for all $n \in N$ and all $x \in X \setminus \{0\}$. By taking n to approach infinity in (2.6) and using (2.2) one obtains (2.4). Replacing x and y by $2^n x$ and $2^n y$, respectively, in (2.3) we get

$$\|DJ_n f(x,y)\| = \left\| \frac{Df(2^n x, 2^n y) - Df(-2^n x, -2^n y)}{2^{n+1}} + \frac{Df(2^n x, 2^n y) + Df(-2^n x, -2^n y)}{2^{2n+1}} \right\|$$

$$\leq \max\left\{ \frac{\varphi(2^n x, 2^n y)}{|2|^{n+1}}, \frac{\varphi(-2^n x, -2^n y)}{|2|^{n+1}}, \frac{\varphi(2^n x, 2^n y)}{|2| \cdot |4|^n}, \frac{\varphi(-2^n x, -2^n y)}{|2| \cdot |4|^n} \right\}$$

for all $x, y \in X \setminus \{0\}$ and all $n \in \mathbb{N}$. Taking the limit as $n \to \infty$ and using (2.1) and Lemma 2.1 we get DT(x, y) = 0 for all $x, y \neq 0$ and so T is a

general quadratic mapping. Now we are going to prove the uniqueness of T. If T' is another general quadratic mapping satisfying (2.4) with T'(0) = f(0), then

$$T'(x) = \sum_{j=0}^{k-1} \left(-\frac{DT'(2^{j}x, -2^{j}x)}{2 \cdot 4^{j+1}} - \frac{DT'(-2^{j}x, 2^{j}x)}{2 \cdot 4^{j+1}} - \frac{DT'(2^{j}x, -2^{j}x)}{2^{j+2}} + \frac{DT'(-2^{j}x, 2^{j}x)}{2^{j+2}} \right) + J_{k}T'(x)$$
$$= J_{k}T'(x)$$

for any $k \in N$ and so

for all $x \in X \setminus \{0\}$. Since T(0) = f(0) = T'(0), we get T(x) = T'(x) for all $x \in X$. This completes the proof of the uniqueness of T. \Box

COROLLARY 2.3. Let 2 < r be a real number and |2| < 1. If $f : X \to Y$ satisfies the inequality

$$||Df(x,y)|| \le \theta(||x||^r + ||y||^r)$$

for all $x, y \in X$, then there exists a unique general quadratic mapping $T: X \to Y$ such that

(2.7)
$$||f(x) - T(x)|| \le 2\theta |2|^{-3} ||x||^r$$

for all $x \in X$ with T(0) = f(0).

Proof. Let
$$\varphi(x, y) = \theta(||x||^r + ||y||^r)$$
. Since $|2| < 1$ and $r - 2 > 0$,
$$\lim_{n \to \infty} |4|^{-n} \varphi(2^n x, 2^n y) = \lim_{n \to \infty} |2|^{n(r-2)} \varphi(x, y) = 0$$

for all $x, y \in X$. Therefore the conditions of Theorem 2.2 are fulfilled and it is easy to see that $\tilde{\varphi}(x) = 2\theta |2|^{-3} ||x||^r$. By Theorem 2.2 there is a unique general quadratic mapping $T: X \to Y$ satisfying (2.7) with T(0) = f(0).

THEOREM 2.4. Let $\varphi: (X \setminus \{0\})^2 \to [0, \infty)$ be a function such that

(2.8)
$$\lim_{n \to \infty} |2|^n \varphi(2^{-n}x, 2^{-n}y) = 0$$

for all $x, y \in X \setminus \{0\}$ and let for each $x \in X \setminus \{0\}$ the limit

(2.9)
$$\lim_{n \to \infty} \max_{0 \le j < n} \left\{ |2|^{j-1} \varphi\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right), |2|^{j-1} \varphi\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right) \right\},$$

denoted by $\tilde{\varphi}(x)$, exists. Suppose that $f: X \to Y$ is a mapping satisfying the inequality

(2.10)
$$||Df(x,y)|| \le \varphi(x,y)$$

for all $x, y \in X \setminus \{0\}$. Then there exists a unique general quadratic mapping $T: X \to Y$ such that

(2.11)
$$||f(x) - T(x)|| \le \tilde{\varphi}(x)$$

for all $x \in X \setminus \{0\}$ with T(0) = f(0). In particular, T is given by

$$T(x) = \lim_{n \to \infty} \frac{4^n}{2} \left(f\left(\frac{x}{2^n}\right) + f\left(\frac{-x}{2^n}\right) - 2f(0) \right) \\ + \lim_{n \to \infty} 2^{n-1} \left(f\left(\frac{x}{2^n}\right) - f\left(\frac{-x}{2^n}\right) \right) + f(0)$$

for all $x \in X$.

Proof. Let $J_n f: X \to Y$ be a mapping defined by

$$J_n f(x) = \frac{4^n}{2} \left(f(2^{-n}x) + f(-2^{-n}x) - 2f(0) \right) + 2^{n-1} \left(f\left(\frac{x}{2^n}\right) - f\left(-\frac{x}{2^n}\right) \right) + f(0)$$

for all $x \in X$ and $n \in \mathbb{N}$. Notice that $J_0 f(x) = f(x)$ and

$$\|J_{j}f(x) - J_{j+1}f(x)\| = \|(2^{2j-1} + 2^{j-1})Df\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right) + (2^{2j-1} - 2^{j-1})Df\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right)\|$$

$$(2.12) \leq \max\left\{|2|^{j-1}\varphi\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right), |2|^{j-1}\varphi\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right)\right\}$$

for all $x \in X \setminus \{0\}$ and all $j \ge 0$. It follows from (2.12) and (2.8) that the sequence $\{J_n f(x)\}$ is Cauchy for all $x \in X \setminus \{0\}$. Since Y is complete and $J_n f(0) = f(0)$, we conclude that $\{J_n f(x)\}$ is convergent for all $x \in X$. Set

$$T(x) := \lim_{n \to \infty} J_n f(x)$$

for all $x \in X$. Using induction one can show that

(2.13)
$$\|J_n f(x) - f(x)\|$$
$$\leq \max_{0 \le j < n} \left\{ |2|^{j-1} \varphi\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right), |2|^{j-1} \varphi\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right) \right\}$$

for all $n \in N$ and all $x \in X \setminus \{0\}$. By taking *n* to approach infinity in (2.13) and using (2.9) one obtains (2.11). Replacing *x* and *y* by $2^{-n}x$ and $2^{-n}y$, respectively, in (2.10) we get

$$\begin{aligned} \|DJ_n f(x,y)\| &= \left\| 2^{n-1} Df\left(\frac{x}{2^n}, \frac{y}{2^n}\right) - 2^{n-1} Df\left(\frac{-x}{2^n}, \frac{-y}{2^n}\right) \right. \\ &+ 2^{2n-1} Df\left(\frac{x}{2^n}, \frac{y}{2^n}\right) + 2^{2n-1} Df\left(\frac{-x}{2^n}, \frac{-y}{2^n}\right) \\ &\leq \max\left\{ |2|^{n-1} \varphi\left(\frac{x}{2^n}, \frac{y}{2^n}\right), |2|^{n-1} \varphi\left(\frac{-x}{2^n}, \frac{-y}{2^n}\right) \right\} \end{aligned}$$

for all $x, y \in X \setminus \{0\}$. Taking the limit as $n \to \infty$ and using (2.8) and Lemma 2.1 we get DT(x, y) = 0 for all $x, y \neq 0$ and so T is a general quadratic mapping. Now we are going to prove the uniqueness of T. If T' is another general quadratic mapping satisfying (2.11) with T'(0) = f(0), then

$$T'(x) - J_k T'(x) = \sum_{j=0}^{k-1} \left((2^{2j-1} + 2^{j-1}) DT'\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right) + (2^{2j-1} - 2^{j-1}) DT'\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right) \right)$$
$$= 0$$

for any $k \in \mathbb{N}$ and so

$$\begin{split} \|T(x) - T'(x)\| &= \lim_{k \to \infty} \|J_k T(x) - J_k T'(x)\| \\ &\leq \lim_{k \to \infty} \max\{\|J_k T(x) - J_k f(x)\|, \|J_k f(x) - J_k T'(x)\|\} \\ &\leq \lim_{k \to \infty} |2|^{k-1} \max\left\{ \left\| T\left(\frac{x}{2^k}\right) - f\left(\frac{x}{2^k}\right) \right\|, \left\| T\left(-\frac{x}{2^k}\right) - f\left(-\frac{x}{2^k}\right) \right\|, \\ &\left\| f\left(\frac{x}{2^k}\right) - T'\left(\frac{x}{2^k}\right) \right\|, \left\| f\left(-\frac{x}{2^k}\right) - T'\left(-\frac{x}{2^k}\right) \right\| \right\} \\ &\leq \lim_{k \to \infty} |2|^{k-1} \tilde{\varphi}\left(\frac{x}{2^k}\right) \\ &= 0 \end{split}$$

for all $x \in X \setminus \{0\}$. Since T(0 = f(0) = T'(0), we get T(x) = T'(x) for all $x \in X$. This completes the proof of the uniqueness of T.

COROLLARY 2.5. Let r < 1 be a real number and |2| < 1. If $f : X \to Y$ satisfies the inequality

$$|Df(x,y)|| \le \theta(||x||^r + ||y||^r)$$

for all $x, y \in X \setminus \{0\}$, then there exists a unique general quadratic mapping $T: X \to Y$ such that

(2.14)
$$||f(x) - T(x)|| \le 2\theta |2|^{-1-r} ||x||^r$$

for all $x \in X \setminus \{0\}$ with T(0) = f(0).

Proof. Let $\varphi(x, y) = \theta(||x||^r + ||y||^r)$. Since |2| < 1 and 1 - r > 0, we get

$$\lim_{n \to \infty} |2|^n \varphi(2^{-n}x, 2^{-n}y) = \lim_{n \to \infty} |2|^{n(1-r)} \varphi(x, y) = 0$$

for all $x, y \in X \setminus \{0\}$. Therefore the conditions of Theorem 2.4 are fulfilled and it is easy to see that $\tilde{\varphi}(x) = 2\theta |2|^{-1-r} ||x||^r$. By Theorem 2.4 there is a unique general quadratic mapping $T: X \to Y$ satisfying (2.14) with T(0) = f(0).

THEOREM 2.6. Let $\varphi : (X \setminus \{0\})^2 \to [0, \infty)$ be a function such that (2.15) $\lim_{n \to \infty} |4|^n \varphi(2^{-n}x, 2^{-n}y) = 0$

and

(2.16)
$$\lim_{n \to \infty} \frac{\varphi(2^n x, 2^n y)}{|2|^n} = 0$$

for all $x, y \in X \setminus \{0\}$ and let for each $x \in X \setminus \{0\}$ the limit

$$\lim_{n \to \infty} \max_{0 \le j < n} \left\{ |2|^{2j-1} \varphi\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right), |2|^{2j-1} \varphi\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right) \right.$$

$$(2.17) \qquad \qquad \frac{\varphi(2^{j}x, -2^{j}x)}{|2|^{j+2}}, \frac{\varphi(-2^{j}x, 2^{j}x)}{|2|^{j+2}} \right\},$$

denoted by $\tilde{\varphi}(x),$ exists. Suppose that $f:X\to Y$ is a mapping satisfying the inequality

(2.18)
$$\|Df(x,y)\| \le \varphi(x,y)$$

for all $x, y \in X \setminus \{0\}$. Then there exists a unique general quadratic mapping $T: X \to Y$ such that

(2.19)
$$||f(x) - T(x)|| \le \tilde{\varphi}(x)$$

for all $x \in X \setminus \{0\}$ with T(0) = f(0). In particular, T is given by

$$T(x) = \lim_{n \to \infty} \frac{4^n}{2} \left(f\left(\frac{x}{2^n}\right) + f\left(\frac{-x}{2^n}\right) - 2f(0) \right) \\ + \lim_{n \to \infty} \frac{f(2^n x) - f(-2^n x)}{2^{n+1}} + f(0)$$

for all $x \in X$.

Proof. Let $J_n f: X \to Y$ be a mapping defined by

$$J_n f(x) = \lim_{n \to \infty} \frac{4^n}{2} \left(f(2^{-n}x) + f(-2^{-n}x) - 2f(0) \right) \\ + \frac{f(2^n x) - f(-2^n x)}{2^{n+1}} + f(0)$$

for all $x \in X$ and $n \in \mathbb{N}$. Notice that $J_0 f(x) = f(x)$ and

$$\begin{aligned} \|J_{j}f(x) - J_{j+1}f(x)\| \\ &= \left\| 2^{2j-1}Df\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right) + 2^{2j-1}Df\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right) \right. \\ &\left. - \frac{Df(2^{j}x, -2^{j}x)}{2^{j+2}} + \frac{Df(-2^{j}x, 2^{j}x)}{2^{j+2}} \right\| \\ &\leq \max\left\{ |2|^{2j-1}\varphi\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right), |2|^{2j-1}\varphi\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right), \\ (2.20) \qquad \qquad \frac{\varphi(2^{j}x, -2^{j}x)}{|2|^{j+2}}, \frac{\varphi(-2^{j}x, 2^{j}x)}{|2|^{j+2}} \right\} \end{aligned}$$

for all $x \in X \setminus \{0\}$ and all $j \ge 0$. It follows from (2.15), (2.16) and (2.20) that the sequence $\{J_n f(x)\}$ is Cauchy for all $x \in X \setminus \{0\}$. Since Y is

complete and $J_n f(0) = f(0)$ for all $n \in \mathbb{N}$, we conclude that $\{J_n f(x)\}$ is convergent for all $x \in X$. Set

$$T(x) := \lim_{n \to \infty} J_n f(x).$$

From (2.20) we have

$$\|J_n f(x) - f(x)\| \le \max_{0 \le j < n} \left\{ |2|^{2j-1} \varphi\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right), |2|^{2j-1} \varphi\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right), \\ (2.21) \qquad \qquad \frac{\varphi(2^j x, -2^j x)}{|2|^{j+2}}, \frac{\varphi(-2^j x, 2^j x)}{|2|^{j+2}} \right\}$$

for all $n \in N$ and all $x \in X \setminus \{0\}$. By taking n to approach infinity in (2.21) and using (2.17) one obtains (2.19). By using (2.18) we get

$$\begin{aligned} \|DJ_n f(x,y)\| &= \left\| \frac{Df(2^n x, 2^n y) - Df(-2^n x, -2^n y)}{2^{n+1}} \\ &+ 2^{2n-1} Df\left(\frac{x}{2^n}, \frac{y}{2^n}\right) + 2^{2n-1} Df\left(\frac{-x}{2^n}, \frac{-y}{2^n}\right) \right\| \\ &\leq \max\left\{ \frac{\varphi(2^n x, 2^n y)}{|2|^{n+1}}, \frac{\varphi(-2^n x, -2^n y)}{|2|^{n+1}}, \right. \\ &\left. |2|^{2n-1} \varphi\left(\frac{x}{2^n}, \frac{y}{2^n}\right), |2|^{2n-1} \varphi\left(\frac{-x}{2^n}, \frac{-y}{2^n}\right) \right\} \end{aligned}$$

for all $x, y \in X \setminus \{0\}$ and all $n \in \mathbb{N}$. Taking the limit as $n \to \infty$ and using (2.15), (2.16) and Lemma 2.1 we get DT(x, y) = 0 for all $x, y \neq 0$ and so T is a general quadratic mapping. Now we are going to prove the uniqueness of T. Assume that T' is another general quadratic mapping satisfying (2.19) with T'(0) = f(0). Then

$$T'(x) = \sum_{j=0}^{k-1} \left(2^{2j-1} DT'\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right) + 2^{2j-1} DT'\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right) - \frac{DT'(2^j x, -2^j x)}{2^{j+2}} + \frac{DT'(-2^j x, 2^j x)}{2^{j+2}} \right) + J_k T'(x)$$

= $J_k T'(x)$

for any $k \in \mathbb{N}$ and so

$$\begin{aligned} \|T(x) - T'(x)\| \\ &= \lim_{k \to \infty} \|J_{2k}T(x) - J_{2k}T'(x)\| \\ &\leq \lim_{k \to \infty} \max\{\|J_{2k}T(x) - J_{2k}f(x)\|, \|J_{2k}f(x) - J_{2k}T'(x)\|\} \\ &\leq \lim_{k \to \infty} \max\{\frac{\|T(2^{2k}x) - f(2^{2k}x)\|}{|2|^{2k+1}}, \frac{\|T(-2^{2k}x) - f(-2^{2k}x)\|}{|2|^{2k+1}}, \\ &\frac{\|f(2^{2k}x) - T'(2^{2k}x)\|}{|2|^{2k+1}}, \frac{\|f(-2^{2k}x) - T'(-2^{2k}x)\|}{|2|^{2k+1}}, \\ &|2|^{4k-1} \|T\left(\frac{x}{2^{2k}}\right) - f\left(\frac{x}{2^{2k}}\right)\|, |2|^{4k-1} \|T\left(-\frac{x}{2^{2k}}\right) - T'\left(-\frac{x}{2^{2k}}\right)\|, \\ &|2|^{4k-1} \|f\left(\frac{x}{2^{2k}}\right) - T'\left(\frac{x}{2^{2k}}\right)\|, |2|^{4k-1} \|f\left(-\frac{x}{2^{2k}}\right) - T'\left(-\frac{x}{2^{2k}}\right)\|, \\ &\leq \lim_{k \to \infty} \lim_{n \to \infty} \max_{0 \le j < n} \left\{ |2|^{2j-2k-2}\varphi\left(\frac{2^{2k}x}{2^{j+1}}, \frac{-2^{2k}x}{2^{j+1}}\right), \\ &|2|^{2j-2k-2}\varphi\left(\frac{-2^{2k}x}{2^{j+1}}, \frac{2^{2k}x}{2^{j+1}}\right) \frac{\varphi(2^{2k+j}x, -2^{2k+j}x)}{|2|^{2k+j+3}}, \\ &\frac{\varphi(-2^{2k+j}x, 2^{2k+j}x)}{|2|^{2k+j+3}}, |2|^{4k+2j-2}\varphi\left(\frac{x}{2^{2k+j+1}}, \frac{-x}{2^{2k+j+1}}\right), \\ &|2|^{4k+2j-2}\varphi\left(\frac{-x}{2^{2k+j+1}}, \frac{x}{2^{2k+j+1}}\right), \\ &|2|^{4k+2j-2}\varphi\left(\frac{-x}{2^{2k+j+1}}, \frac{x}{2^{2k+j+1}}\right), \\ &(2.22) &\frac{\varphi(2^{j-2k}x, -2^{j-2k}x)}{|2|^{j-4k+3}}, \frac{\varphi(-2^{j-2k}x, 2^{j-2k}x)}{|2|^{j-4k+3}}\} \end{aligned}$$

for all $x \in X \backslash \{0\}$ and all $k \in \mathbb{N}.$ On the other hand, we have the inequalties

$$\begin{split} \lim_{k \to \infty} \lim_{n \to \infty} \max_{0 \le j < n} \left\{ |2|^{2j - 2k - 2} \varphi\left(\frac{2^{2k}x}{2^{j+1}}, \frac{-2^{2k}x}{2^{j+1}}\right) \right\} \\ \le \lim_{k \to \infty} \lim_{n \to \infty} \max\left\{ \max_{0 \le j < k} \left\{ |2|^{2j - 2k - 2} \varphi\left(\frac{2^{2k}x}{2^{j+1}}, \frac{-2^{2k}x}{2^{j+1}}\right) \right\}, \\ \max_{k \le j < 2k} \left\{ |2|^{2j - 2k - 2} \varphi\left(\frac{2^{2k}x}{2^{j+1}}, \frac{-2^{2k}x}{2^{j+1}}\right) \right\}, \\ \max_{2k \le j < n} \left\{ |2|^{2j - 2k - 2} \varphi\left(\frac{2^{2k}x}{2^{j+1}}, \frac{-2^{2k}x}{2^{j+1}}\right) \right\} \right\} \end{split}$$

Chang-Ju Lee and Yang-Hi Lee

$$\leq \lim_{k \to \infty} \max\left\{ |2|^{-4} \max_{k \leq j < 2k} \left\{ \frac{\varphi(2^{j}x, 2^{j}x)}{|2|^{j}} \right\}, |2|^{k-4} \max_{0 \leq j < k} \left\{ \frac{\varphi(2^{j}x, 2^{j}x)}{|2|^{j}} \right\}, \\ |2|^{2k-2} \lim_{n \to \infty} \max_{0 \leq j < n-2k} \left\{ |4|^{j} \varphi\left(\frac{x}{2^{j+1}}, \frac{-x}{2^{j+1}}\right) \right\} \right\}$$
$$= 0,$$

$$\lim_{k \to \infty} \lim_{n \to \infty} \max_{0 \le j < n} \left\{ \frac{\varphi(2^{2k+j}x, -2^{2k+j}x)}{|2|^{2k+j+3}} \right\}$$
$$\leq \lim_{k \to \infty} \lim_{n \to \infty} \max_{2k \le j < n-2k} \left\{ \frac{\varphi(2^jx, -2^jx)}{|2|^{j+3}} \right\}$$
$$= 0,$$

$$\begin{split} &\lim_{k \to \infty} \lim_{n \to \infty} \max_{0 \le j < n} \left\{ |2|^{4k+2j-2} \varphi\left(\frac{-x}{2^{2k+j+1}}, \frac{x}{2^{2k+j+1}}\right) \right\} \\ &\le \lim_{k \to \infty} \lim_{n \to \infty} \max_{2k \le j < n-2k} \left\{ ||2|^{2j-2} \varphi\left(\frac{-x}{2^{j+1}}, \frac{x}{2^{j+1}}\right) \right\} \\ &= 0, \end{split}$$

$$\begin{split} \lim_{k \to \infty} \lim_{n \to \infty} \max_{0 \le j < n} \left\{ \frac{\varphi(-2^{j-2k}x, 2^{j-2k}x)}{|2|^{j-4k+3}} \right\} \\ \le \lim_{k \to \infty} \lim_{n \to \infty} \max \left\{ \max_{0 \le j < k} \left\{ \frac{\varphi(-2^{j-2k}x, 2^{j-2k}x)}{|2|^{j-4k+3}} \right\}, \\ & \max_{k \le j < 2k} \left\{ \frac{\varphi(-2^{j-2k}x, 2^{j-2k}x)}{|2|^{j-4k+3}} \right\}, \\ & \max_{2k \le j < n} \left\{ \frac{\varphi(-2^{j-2k}x, 2^{j-2k}x)}{|2|^{j-4k+3}} \right\} \right\} \\ \le \lim_{k \to \infty} \max \left\{ |2|^{-4} \max_{k+1 \le j < 2k+1} \left\{ |4|^j \varphi\left(\frac{x}{2^j}, \frac{-x}{2^j}\right) \right\}, \\ & |2|^{k-4} \max_{1 \le j < k+1} \left\{ |4|^j \varphi\left(\frac{x}{2^j}, \frac{-x}{2^j}\right) \right\}, \\ & |2|^{2k-3} \lim_{n \to \infty} \max_{0 \le j < n-2k} \left\{ \frac{\varphi(2^j x, 2^j x)}{|2|^j} \right\} \right\} \\ = 0 \end{split}$$

for all $x \in X \setminus \{0\}$ and all $k \in \mathbb{N}$. So the right hand side of (2.22) tends to 0 as $k \to \infty$. Since T(0) = f(0) = T'(0), we conclude that T(x) = T'(x) for all $x \in X$. This completes the proof of the uniqueness of T. \Box

COROLLARY 2.7. Let 1 < r < 2 be a real number and |2| < 1. If $f: X \to Y$ satisfies the inequality

$$||Df(x,y)|| \le \theta(||x||^r + ||y||^r)$$

for all $x, y \in X \setminus \{0\}$, then there exists a unique general quadratic mapping $T: X \to Y$ such that

(2.23)
$$||f(x) - T(x)|| \le 2\theta |2|^{-1-r} ||x||^r$$

for all $x \in X \setminus \{0\}$ with T(0) = f(0).

Proof. Let $\varphi(x, y) = \theta(||x||^r + ||y||^r)$. Since |2| < 1 and 1 < r < 2, we have

$$\lim_{n \to \infty} |4|^n \varphi(2^{-n}x, 2^{-n}y) = \lim_{n \to \infty} |2|^{n(2-r)} \varphi(x, y) = 0$$

and

$$\lim_{n \to \infty} \frac{\varphi(2^n x, 2^n y)}{|2|^n} = \lim_{n \to \infty} |2|^{n(r-1)} \varphi(x, y) = 0$$

for all $x, y \in X$. Therefore the conditions of Theorem 2.6 are fulfilled and it is easy to see that $\tilde{\varphi}(x) = 2\theta |2|^{-1-r} ||x||^r$. By Theorem 2.6 there is a unique general quadratic mapping $T: X \to Y$ satisfying (2.23) with T(0) = f(0).
