

CHARACTERIZATIONS OF THE POWER FUNCTION DISTRIBUTION BY THE INDEPENDENCE OF RECORD VALUES

SE-KYUNG CHANG*

ABSTRACT. In this paper, we present characterizations of the power function distribution by the independence of record values. We establish that $X \in POW(1, \nu)$ for $\nu > 0$, if and only if $\frac{X_{L(n)}}{X_{L(n)} - X_{L(n+1)}}$ and $X_{L(n)}$ are independent for $n \geq 1$. And we prove that $X \in POW(1, \nu)$ for $\nu > 0$, if and only if $\frac{X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $X_{L(n)}$ are independent for $n \geq 1$. Also we characterize that $X \in POW(1, \nu)$ for $\nu > 0$, if and only if $\frac{X_{L(n)} + X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $X_{L(n)}$ are independent for $n \geq 1$.

1. Introduction

The record values model was introduced by Chandler([4]). Suppose that $X_1, X_2, \dots$ is a sequence of independent and identically distributed (i.i.d.) random variables with cumulative distribution function (cdf) $F(x)$ and probability density function (pdf) $f(x)$. Let $Y_n = \min\{X_1, X_2, \dots, X_n\}$ for $n \geq 1$. We say X_j is a lower record value of $\{X_n, n \geq 1\}$, if $Y_j < Y_{j-1}$ for $j > 1$. By definition, X_1 is a lower record value.

The indices at which the lower record values occur are given by the lower record times $L(n)$ for $n \geq 1$, where $L(n) = \min\{j | j > L(n-1), X_j < X_{L(n-1)}, n \geq 2\}$ and $L(1) = 1$.

A continuous random variable X is said to have the power function distribution with two parameters $\alpha > 0$ and $\nu > 0$ if it has a cdf $F(x)$

Received March 15, 2007.

Key words and phrases: record value, characterization, independence, power function distribution.

of the form

$$(1) \quad F(x) = \alpha^{-\nu} x^\nu, \quad 0 < x < \alpha, \quad \alpha > 0, \quad \nu > 0.$$

A notation that designates that X has the cdf (1) is $X \in POW(\alpha, \nu)$.

Some characterizations by the independence of record values are known. In [2] and [3], Ahsanullah studied, if $X \in PAR(\alpha, \beta)$ for $\alpha > 0$ and $\beta > 0$, then $\frac{X_{U(n)}}{X_{U(m)}}$ and $X_{U(m)}$ are independent for $0 < m < n$, and if $X \in WEI(\theta, \alpha)$ for $\theta > 0$ and $\alpha > 0$, then $\frac{X_{U(m)}}{X_{U(n)}}$ and $X_{U(n)}$ are independent for $0 < m < n$. The above result are not necessary and sufficient.

In this paper, we will give characterizations of necessary and sufficient for the power function distribution with the parameter $\alpha = 1$ by the independence of the lower record values.

2. Main results

THEOREM 2.1. *Let $\{X_n, n \geq 1\}$ be a sequence of i.i.d. random variables with cdf $F(x)$ which is an absolutely continuous with pdf $f(x)$ and $F(0) = 0$, $F(1) = 1$ and $F(x) < 1$ for all $0 < x < 1$. Then $F(x) = x^\nu$ for all $0 < x < 1$ and $\nu > 0$, if and only if $\frac{X_{L(n)}}{X_{L(n)} - X_{L(n+1)}}$ and $X_{L(n)}$ are independent for $n \geq 1$.*

Proof. If $F(x) = x^\nu$ for all $0 < x < 1$ and $\nu > 0$, then the joint pdf $f_{(n),(n+1)}(x, y)$ of $X_{L(n)}$ and $X_{L(n+1)}$ is

$$\begin{aligned} f_{(n),(n+1)}(x, y) &= \frac{(H(x))^{n-1} h(x) f(y)}{\Gamma(n)} \\ &= \frac{\nu^{n+1} (-\ln x)^{n-1} y^{\nu-1}}{\Gamma(n) x} \end{aligned}$$

for all $0 < y < x < 1$, $\nu > 0$ and $n \geq 1$.

Consider the functions $U = \frac{X_{L(n)}}{X_{L(n)} - X_{L(n+1)}}$ and $W = X_{L(n)}$. It follows that $x_{L(n)} = w$, $x_{L(n+1)} = \frac{(u-1)w}{u}$ and $|J| = \frac{w}{u^2}$. Thus we can

write the joint pdf $f_{(U),(W)}(u, w)$ of U and W as

$$(2) \quad f_{(U),(W)}(u, w) = \frac{\nu^{n+1} (u-1)^{\nu-1} (-\ln w)^{n-1} w^{\nu-1}}{\Gamma(n) u^{\nu+1}}$$

for all $u > 1$, $0 < w < 1$, $\nu > 0$ and $n \geq 1$.

The marginal pdf $f_{(U)}(u)$ of U is given by

$$(3) \quad \begin{aligned} f_{(U)}(u) &= \int_0^1 f_{(U),(W)}(u, w) dw \\ &= \frac{\nu (u-1)^{\nu-1}}{u^{\nu+1}} \end{aligned}$$

for all $u > 1$ and $\nu > 0$.

Also, by the above transformations, the pdf $f_{(W)}(w)$ of W is the function of $X_{L(n)}$. Thus the pdf $f_{(W)}(w)$ of W is given by

$$(4) \quad \begin{aligned} f_{(W)}(w) &= \frac{(H(w))^{n-1} f(w)}{\Gamma(n)} \\ &= \frac{\nu^n (-\ln w)^{n-1} w^{\nu-1}}{\Gamma(n)} \end{aligned}$$

for all $0 < w < 1$, $\nu > 0$ and $n \geq 1$.

From (2), (3) and (4), we obtain $f_{(U)}(v)f_{(W)}(w) = f_{(U),(W)}(u, w)$.

Hence $U = \frac{X_{L(n)}}{X_{L(n)} - X_{L(n+1)}}$ and $W = X_{L(n)}$ are independent for $n \geq 1$.

Now we will prove the sufficient condition. The joint pdf $f_{(n),(n+1)}(x, y)$ of $X_{L(n)}$ and $X_{L(n+1)}$ is

$$f_{(n),(n+1)}(x, y) = \frac{(H(x))^{n-1} h(x) f(y)}{\Gamma(n)}$$

for all $0 < y < x < 1$, $\nu > 0$ and $n \geq 1$, where $H(x) = -\ln F(x)$ and $h(x) = -\frac{d}{dx}(H(x)) = \frac{f(x)}{F(x)}$.

Let us use the transformations $U = \frac{X_{L(n)}}{X_{L(n)} - X_{L(n+1)}}$ and $W = X_{L(n)}$.

The Jacobian of the transformations is $|J| = \frac{w}{u^2}$. Thus we can write the joint pdf $f_{(U),(W)}(u, w)$ of U and W as

$$(5) \quad f_{(U),(W)}(u, w) = \frac{f\left(\frac{(u-1)w}{u}\right) (H(w))^{n-1} h(w) w}{\Gamma(n) u^2}$$

for all $u > 1$, $0 < w < 1$ and $n \geq 1$.

The pdf $f_{(w)}(w)$ of W is given by

$$(6) \quad f_{(w)}(w) = \frac{(H(w))^{n-1} f(w)}{\Gamma(n)}$$

for all $0 < w < 1$ and $n \geq 1$.

From (5) and (6), we obtain the pdf $f_{(u)}(u)$ of U

$$f_{(u)}(u) = \frac{f\left(\frac{(u-1)w}{u}\right) h(w) w}{u^2 f(w)}$$

for all $u > 1$, $0 < w < 1$ and $n \geq 1$, where $h(x) = \frac{f(x)}{F(x)}$.

That is,

$$f_{(u)}(u) = \frac{\partial}{\partial u} \left(F\left(\frac{(u-1)w}{u}\right) / F(w) \right).$$

Since U and W are independent, we must have

$$(7) \quad F\left(\frac{(u-1)w}{u}\right) = F\left(\frac{u-1}{u}\right) F(w)$$

for all $u > 1$ and $0 < w < 1$.

Upon substituting $\frac{(u-1)}{u} = u_1$ in (7), then we get

$$(8) \quad F(u_1 w) = F(u_1) F(w)$$

for all $0 < u_1 < 1$ and $0 < w < 1$.

By the functional equations (see, [1]), the only continuous solution of (8) with the boundary conditions $F(0) = 0$ and $F(1) = 1$ is

$$F(x) = x^\nu$$

for all $0 < x < 1$ and $\nu > 0$.

This completes the proof. $\square$

THEOREM 2.2. *Let $\{X_n, n \geq 1\}$ be a sequence of i.i.d. random variables with cdf $F(x)$ which is an absolutely continuous with pdf $f(x)$ and $F(0) = 0$, $F(1) = 1$ and $F(x) < 1$ for all $0 < x < 1$. Then $F(x) = x^\nu$ for all $0 < x < 1$ and $\nu > 0$, if and only if $\frac{X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $X_{L(n)}$ are independent for $n \geq 1$.*

Proof. In the same manner as Theorem 2.1, we consider the functions $U = \frac{X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $W = X_{L(n)}$. It follows that $x_{L(n)} = w$, $x_{L(n+1)} = \frac{uw}{(u+1)}$ and $|J| = \frac{w}{(u+1)^2}$. Thus we can write the joint pdf $f_{(U),(W)}(u, w)$ of U and W as

$$(9) \quad f_{(U),(W)}(u, w) = \frac{\nu^{n+1} u^{\nu-1} (-\ln w)^{n-1} w^{\nu-1}}{\Gamma(n) (u+1)^{\nu+1}}$$

for all $u > 0$, $0 < w < 1$, $\nu > 0$ and $n \geq 1$.

The marginal pdf $f_{(U)}(u)$ of U is given by

$$(10) \quad f_{(U)}(u) = \frac{\nu u^{\nu-1}}{(u+1)^{\nu+1}}$$

for all $u > 0$ and $\nu > 0$.

Also, the pdf $f_{(W)}(w)$ of W is given by

$$(11) \quad f_{(W)}(w) = \frac{\nu^n (-\ln w)^{n-1} w^{\nu-1}}{\Gamma(n)}$$

for all $0 < w < 1$, $\nu > 0$ and $n \geq 1$.

From (9), (10) and (11), we obtain $f_{(U)}(u) f_{(W)}(w) = f_{(U),(W)}(u, w)$.

Hence $U = \frac{X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $W = X_{L(n)}$ are independent for $n \geq 1$.

Now we will prove the sufficient condition. By the same manner as Theorem 2.1, let us use the transformations $U = \frac{X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $W = X_{L(n)}$. The Jacobian of the transformations is $|J| = \frac{w}{(u+1)^2}$. Thus we can write the joint pdf $f_{(U),(W)}(u, w)$ of U and W as

$$(12) \quad f_{(U),(W)}(u, w) = \frac{f\left(\frac{uw}{u+1}\right) (H(w))^{n-1} h(w) w}{\Gamma(n) (u+1)^2}$$

for all $u > 0$, $0 < w < 1$ and $n \geq 1$.

The pdf $f_{(W)}(w)$ of W is given by

$$(13) \quad f_{(W)}(w) = \frac{(H(w))^{n-1} f(w)}{\Gamma(n)}$$

for all $0 < w < 1$ and $n \geq 1$.

From (12) and (13), we obtain the pdf $f_{(U)}(u)$ of U

$$f_{(U)}(u) = \frac{f\left(\frac{uw}{u+1}\right) h(w) w}{(u+1)^2 f(w)}$$

for all $u > 0$, $0 < w < 1$ and $n \geq 1$, where $h(x) = \frac{f(x)}{F(x)}$.

That is,

$$f_{(U)}(u) = \frac{\partial}{\partial u} \left(F\left(\frac{uw}{u+1}\right) / F(w) \right).$$

Since U and W are independent, we must have

$$(14) \quad F\left(\frac{uw}{u+1}\right) = F\left(\frac{u}{u+1}\right) F(w)$$

for all $u > 0$ and $0 < w < 1$.

Upon substituting $\frac{u}{u+1} = u_2$ in (14), then we get

$$(15) \quad F(u_2 w) = F(u_2) F(w)$$

for all $0 < u_2 < 1$ and $0 < w < 1$.

By the functional equations (see, [1]), the only continuous solution of (15) with the boundary conditions $F(0) = 0$ and $F(1) = 1$ is

$$F(x) = x^\nu$$

for all $0 < x < 1$ and $\nu > 0$.

This completes the proof. $\square$

THEOREM 2.3. *Let $\{X_n, n \geq 1\}$ be a sequence of i.i.d. random variables with cdf $F(x)$ which is an absolutely continuous with pdf $f(x)$ and $F(0) = 0$, $F(1) = 1$ and $F(x) < 1$ for all $0 < x < 1$. Then $F(x) = x^\nu$ for all $0 < x < 1$ and $\nu > 0$, if and only if $\frac{X_{L(n)} + X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $X_{L(n)}$ are independent for $n \geq 1$.*

Proof. In the same manner as Theorem 2.1, we consider the functions $U = \frac{X_{L(n)} + X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $W = X_{L(n)}$. It follows that $x_{L(n)} = w$, $x_{L(n+1)} = \frac{(u-1)w}{(u+1)}$ and $|J| = \frac{2w}{(u+1)^2}$. Thus we can write the joint pdf $f_{(U),(W)}(u, w)$ of U and W as

$$(16) \quad f_{(U),(W)}(u, w) = \frac{2\nu^{n+1} (u-1)^{\nu-1} (-\ln w)^{n-1} w^{\nu-1}}{\Gamma(n) (u+1)^{\nu+1}}$$

for all $u > 1$, $0 < w < 1$, $\nu > 0$ and $n \geq 1$.

The marginal pdf $f_{(U)}(u)$ of U is given by

$$(17) \quad f_{(U)}(u) = \frac{2\nu(u-1)^{\nu-1}}{(u+1)^{\nu+1}}$$

for all $u > 1$ and $\nu > 0$.

Also, the pdf $f_{(W)}(w)$ of W is given by

$$(18) \quad f_{(W)}(w) = \frac{\nu^n (-\ln w)^{n-1} w^{\nu-1}}{\Gamma(n)}$$

for all $0 < w < 1$, $\nu > 0$ and $n \geq 1$.

From (16), (17) and (18), we obtain $f_{(U)}(v)f_{(W)}(w) = f_{(U),(W)}(u, w)$.

Hence $U = \frac{X_{L(n)} + X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $W = X_{L(n)}$ are independent for $n \geq 1$.

Now we will prove the sufficient condition. By the same manner as Theorem 2.1, let us use the transformations $U = \frac{X_{L(n)} + X_{L(n+1)}}{X_{L(n)} - X_{L(n+1)}}$ and $W = X_{L(n)}$. The Jacobian of the transformations is $|J| = \frac{2w}{(u+1)^2}$. Thus we can write the joint pdf $f_{(U),(W)}(u, w)$ of U and W as

$$(19) \quad f_{(U),(W)}(u, w) = \frac{2f\left(\frac{(u-1)w}{u+1}\right)(H(w))^{n-1}h(w)w}{\Gamma(n)(u+1)^2}$$

for all $u > 1$, $0 < w < 1$ and $n \geq 1$.

The pdf $f_{(W)}(w)$ of W is given by

$$(20) \quad f_{(W)}(w) = \frac{(H(w))^{n-1}f(w)}{\Gamma(n)}$$

for all $0 < w < 1$ and $n \geq 1$.

From (19) and (20), we obtain the pdf $f_{(U)}(u)$ of U

$$f_{(U)}(u) = \frac{2f\left(\frac{(u-1)w}{u+1}\right)h(w)w}{(u+1)^2 f(w)}$$

for all $u > 1$, $0 < w < 1$ and $n \geq 1$, where $h(x) = \frac{f(x)}{F(x)}$.

That is,

$$f_{(U)}(u) = \frac{\partial}{\partial u} \left(F\left(\frac{(u-1)w}{u+1}\right) / F(w) \right).$$

Since U and W are independent, we must have

$$(21) \quad F\left(\frac{(u-1)w}{(u+1)}\right) = F\left(\frac{u-1}{u+1}\right) F(w)$$

for all $u > 1$ and $0 < w < 1$.

Upon substituting $\frac{u-1}{u+1} = u_3$ in (21), then we get

$$(22) \quad F(u_3 w) = F(u_3)F(w)$$

for all $0 < u_3 < 1$ and $0 < w < 1$.

By the functional equations (see, [1]), the only continuous solution of (22) with the boundary conditions $F(0) = 0$ and $F(1) = 1$ is

$$F(x) = x^\nu$$

for all $0 < x < 1$ and $\nu > 0$.

This completes the proof. $\square$
