

# STABILITY OF THE RECIPROCAL DIFFERENCE AND ADJOINT FUNCTIONAL EQUATIONS IN $m$ -VARIABLES

YOUNG WHAN LEE\* AND GWANG HUI KIM\*\*

ABSTRACT. In this paper, we prove stability of the reciprocal difference functional equation

$$r\left(\frac{\sum_{i=1}^m x_i}{m}\right) - r\left(\sum_{i=1}^m x_i\right) = \frac{(m-1) \prod_{i=1}^m r(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} r(x_k)}$$

and the reciprocal adjoint functional equation

$$r\left(\frac{\sum_{i=1}^m x_i}{m}\right) + r\left(\sum_{i=1}^m x_i\right) = \frac{(m+1) \prod_{i=1}^m r(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} r(x_k)}$$

in  $m$ -variables. Stability of the reciprocal difference functional equation and the reciprocal adjoint functional equation in two variables were proved by K. Ravi, J. M. Rassias and B. V. Senthil Kumar [13]. We extend their result to  $m$ -variables in similar types.

## 1. Introduction

In 1940, Ulam [14] proposed the stability problem of the functional equation;

*Let  $G_1$  be a group and let  $G_2$  be a metric group with a metric  $d(\cdot, \cdot)$ . Given  $\epsilon > 0$ , does there exist a  $\delta > 0$  such that if a mapping  $h : G_1 \rightarrow G_2$  satisfies the inequality  $d(h(xy), h(x)h(y)) < \delta$  for all  $x, y \in G_1$ , then there exists a homomorphism  $H : G_1 \rightarrow G_2$  with  $d(h(x), H(x)) < \epsilon$  for all  $x \in G_1$ ?*

In 1941, Hyers [5] answered the Ulam's question for the case of the additive mapping on the Banach spaces.

Let  $G_1$  and  $G_2$  be Banach spaces. Assume that a mapping  $f : G_1 \rightarrow G_2$  satisfies the inequality

$$\|f(x+y) - f(x) - f(y)\| \leq \varepsilon$$

for all  $x, y \in G_1$ . Then the limit  $g(x) := \lim_{n \rightarrow \infty} \frac{f(2^n x)}{2^n}$  exists for all  $x \in G_1$  and  $g$  is the unique additive mapping such that

$$\|f(x) - g(x)\| \leq \varepsilon, \quad \forall x \in G_1.$$

In 1978, Th. M. Rassias [12] generalized the Hyers's result bounded by constant to an approximation involving a sum of norms;

Let  $G_1$  be a vector space and  $G_2$  a Banach space. Assume that a mapping  $f : G_1 \rightarrow G_2$  satisfies

$$\|f(x+y) - f(x) - f(y)\| \leq \varepsilon(\|x\|^p + \|y\|^p)$$

for all  $x, y \in G_1$ ,  $\varepsilon > 0$  and  $p < 1$ . Then the limit  $g(x) := \lim_{n \rightarrow \infty} \frac{f(2^n x)}{2^n}$  exists for all  $x \in G_1$  and  $g$  is the unique additive mapping such that

$$\|f(x) - g(x)\| \leq \frac{2\varepsilon}{2-2^p} \|x\|^p, \quad \forall x \in G_1.$$

During the last two decades, a number of papers and research monographs have been published on various generalizations and applications of the generalized Hyers-Ulam stability to a number of functional equations and mappings (see [1]-[14]). P. Găvruta [4] provided a further generalization of Th. M. Rassias' Theorem.

K. Ravi, J. M. Rassias and B. V. Senthil Kumar [13] proved some interesting results on the stability of a reciprocal difference functional equation

$$r\left(\frac{x+y}{2}\right) - r(x+y) = \frac{r(x)r(y)}{r(x)+r(y)}$$

and the reciprocal adjoint functional equation

$$r\left(\frac{x+y}{2}\right) + r(x+y) = \frac{3r(x)r(y)}{r(x)+r(y)}.$$

In this paper, we prove the stability of a reciprocal difference functional equation

$$(1.1) \quad r\left(\frac{\sum_{i=1}^m x_i}{m}\right) - r\left(\sum_{i=1}^m x_i\right) = \frac{(m-1) \prod_{i=1}^m r(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} r(x_k)}$$

and also prove stability of a reciprocal adjoint functional equation

$$(1.2) \quad r\left(\frac{\sum_{i=1}^m x_i}{m}\right) + r\left(\sum_{i=1}^m x_i\right) = \frac{(m+1) \prod_{i=1}^m r(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} r(x_k)}$$

with  $m$ -variables in the sense of Gâvruta, which is bounded by an arbitrary function.

## 2. Stability

**THEOREM 2.1.** *Let  $X$  and  $Y$  be spaces of non-zero real numbers and  $2 \leq m \in \mathbb{N}$ . Assume that  $f : X \rightarrow Y$  satisfies the functional inequality*

$$(2.1) \quad \left| f\left(\frac{\sum_{i=1}^m x_i}{m}\right) - f\left(\sum_{i=1}^m x_i\right) - \frac{(m-1) \prod_{i=1}^m f(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} f(x_k)} \right| \leq \phi(x_1, x_2, \dots, x_m)$$

for all  $x_1, x_2, \dots, x_m \in X$ , where  $\phi : X^m \rightarrow Y$  is a function such that

$$\Phi(x_1, x_2, \dots, x_m) := \sum_{i=0}^{\infty} \frac{1}{m^i} \phi\left(\frac{x_1}{m^{i+1}}, \frac{x_2}{m^{i+1}}, \dots, \frac{x_m}{m^{i+1}}\right) < \infty.$$

Then there exists a unique reciprocal difference mapping  $r : X \rightarrow Y$  which satisfies (1.1) and

$$|f(x) - r(x)| \leq \Phi(x, x, \dots, x)$$

for all  $x \in X$ .

*Proof.* For each  $i = 1, 2, \dots, m$ , replacing  $x_i$  by  $\frac{x}{m}$  in (2.1), we obtain

$$(2.2) \quad \left| \frac{1}{m} f\left(\frac{x}{m}\right) - f(x) \right| \leq \phi\left(\frac{x}{m}, \frac{x}{m}, \dots, \frac{x}{m}\right).$$

Again replacing  $x$  by  $\frac{x}{m}$  in (2.2) and dividing by  $m$  we get

$$\left| \frac{1}{m^2} f\left(\frac{x}{m^2}\right) - f(x) \right| \leq \phi\left(\frac{x}{m}, \dots, \frac{x}{m}\right) + \frac{1}{m} \phi\left(\frac{x}{m^2}, \dots, \frac{x}{m^2}\right).$$

Again replacing  $x$  by  $\frac{x}{m}$  in the above inequality and dividing by  $m$  we get

$$\left| \frac{1}{m^3} f\left(\frac{x}{m^3}\right) - f(x) \right| \leq \sum_{i=0}^2 \frac{1}{m^i} \phi\left(\frac{x}{m^{i+1}}, \dots, \frac{x}{m^{i+1}}\right).$$

Proceeding further and using induction on a positive integer  $n$ , we get

$$(2.3) \quad \left| \frac{1}{m^n} f\left(\frac{x}{m^n}\right) - f(x) \right| \leq \sum_{i=0}^{n-1} \frac{1}{m^i} \phi\left(\frac{x}{m^{i+1}}, \dots, \frac{x}{m^{i+1}}\right) \\ \leq \sum_{i=0}^{\infty} \frac{1}{m^i} \phi\left(\frac{x}{m^{i+1}}, \dots, \frac{x}{m^{i+1}}\right)$$

for all  $x \in X$ . In order to prove the convergence of the sequence  $\left\{ \frac{1}{m^n} f\left(\frac{x}{m^n}\right) \right\}$ , replace  $x$  by  $\frac{x}{m^p}$  in (2.3) and divide by  $m^p$ , we find that for  $n > p > 0$

$$\left| \frac{1}{m^p} f\left(\frac{x}{m^p}\right) - \frac{1}{m^{n+p}} f\left(\frac{x}{m^{n+p}}\right) \right| = \frac{1}{m^p} \left| f\left(\frac{x}{m^p}\right) - \frac{1}{m^n} f\left(\frac{x}{m^{n+p}}\right) \right| \\ \leq \sum_{i=0}^{n-1} \frac{1}{m^{p+i}} \phi\left(\frac{x}{m^{p+i+1}}, \dots, \frac{x}{m^{p+i+1}}\right) \\ \leq \sum_{i=p}^{\infty} \frac{1}{m^i} \phi\left(\frac{x}{m^{i+1}}, \dots, \frac{x}{m^{i+1}}\right).$$

Allowing  $p \rightarrow \infty$ , the right-hand side of the above inequality tends to 0. Thus the sequence  $\left\{ \frac{1}{m^n} f\left(\frac{x}{m^n}\right) \right\}$  is a Cauchy sequence. Thus we may define a mapping  $r : X \rightarrow Y$  by

$$r(x) := \lim_{n \rightarrow \infty} \frac{1}{m^n} f\left(\frac{x}{m^n}\right), \quad \forall x \in X.$$

By (2.3) with  $n \rightarrow \infty$ , we have

$$|f(x) - r(x)| \leq \Phi(x, \dots, x), \quad \forall x \in X.$$

For each  $i = 1, 2, \dots, m$ , replacing  $x_i$  by  $\frac{x_i}{m^n}$  in (2.1) and dividing by  $m^n$ , we obtain

$$\frac{1}{m^n} \left| f\left(\frac{1}{m^n} \left(\frac{\sum_{i=1}^m x_i}{m}\right)\right) - f\left(\frac{1}{m^n} \left(\sum_{i=1}^m x_i\right)\right) \right. \\ \left. - \frac{(m-1) \prod_{i=1}^m f\left(\frac{x_i}{m^n}\right)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} f\left(\frac{x_k}{m^n}\right)} \right| \\ \leq \frac{1}{m} \left( \frac{1}{m^{n-1}} \phi\left(\frac{x_1}{m^n}, \frac{x_2}{m^n}, \dots, \frac{x_m}{m^n}\right) \right)$$

for all  $(x_1, x_2, \dots, x_m) \in X^m$ . Letting  $n \rightarrow \infty$ , we have

$$r\left(\frac{\sum_{i=1}^m x_i}{m}\right) - r\left(\sum_{i=1}^m x_i\right) = \frac{(m-1) \prod_{i=1}^m r(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} r(x_k)}$$

for all  $(x_1, x_2, \dots, x_m) \in X^m$ . Now let  $s : X \rightarrow Y$  be an another function which satisfies the equation (1.1) and  $|f(x) - s(x)| \leq \Phi(x, x, \dots, x)$  for all for all  $x \in X$ . Since  $m^n s(x) = s(\frac{x}{m^n})$  and  $m^n r(x) = r(\frac{x}{m^n})$ , we have

$$\begin{aligned} |s(x) - r(x)| &= \frac{1}{m^n} \left| s\left(\frac{x}{m^n}\right) - r\left(\frac{x}{m^n}\right) \right| \\ &\leq \frac{1}{m^n} \left( \left| s\left(\frac{x}{m^n}\right) - f\left(\frac{x}{m^n}\right) \right| + \left| f\left(\frac{x}{m^n}\right) - r\left(\frac{x}{m^n}\right) \right| \right) \\ &\leq 2 \sum_{i=0}^{\infty} \frac{1}{m^{n+i}} \phi\left(\frac{x}{m^{n+i+1}}, \frac{x}{m^{n+i+1}}, \dots, \frac{x}{m^{n+i+1}}\right) \end{aligned}$$

for all  $x \in X$ . Allowing  $n \rightarrow \infty$  in the above inequality, we find that  $r$  is unique. This completes the proof of the theorem.  $\square$

**COROLLARY 2.2.** *Let  $X$  and  $Y$  be spaces of non-zero real numbers and  $2 \leq m \in N$ . Assume that  $f : X \rightarrow Y$  satisfies the functional inequality*

$$\left| f\left(\frac{\sum_{i=1}^m x_i}{m}\right) - f\left(\sum_{i=1}^m x_i\right) - \frac{(m-1) \prod_{i=1}^m f(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} f(x_k)} \right| \leq \delta$$

for all  $x_1, x_2, \dots, x_m \in X$ . Then there exists a unique reciprocal difference mapping  $r : X \rightarrow Y$  which satisfies (1.1) and

$$|f(x) - r(x)| \leq \frac{m}{m-1} \delta$$

for all  $x \in X$ .

*Proof.* Let  $\phi(x_1, x_2, \dots, x_m) = \delta$  for all  $x_1, x_2, \dots, x_m \in X^m$ . Then, by Theorem 1,  $\Phi(x, x, \dots, x) = \sum_{i=0}^{\infty} \frac{\delta}{m^i} = \frac{m}{m-1} \delta$  for all  $x \in X$ . This completes the proof of the corollary.  $\square$

**THEOREM 2.3.** *Let  $X$  and  $Y$  be spaces of non-zero real numbers and  $2 \leq m \in N$ . Assume that  $f : X \rightarrow Y$  satisfies the functional inequality*

$$\begin{aligned} (2.4) \quad &\left| f\left(\frac{\sum_{i=1}^m x_i}{m}\right) - f\left(\sum_{i=1}^m x_i\right) - \frac{(m-1) \prod_{i=1}^m f(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} f(x_k)} \right| \\ &\leq \psi(x_1, x_2, \dots, x_m) \end{aligned}$$

for all  $x_1, x_2, \dots, x_m \in X$ , where  $\psi : X^m \rightarrow Y$  is a function such that for all  $x_1, x_2, \dots, x_m \in X$

$$\Psi(x_1, x_2, \dots, x_m) := \sum_{i=0}^{\infty} m^{i+1} \psi(m^i x_1, m^i x_2, \dots, m^i x_m) < \infty.$$

Then there exists a unique reciprocal adjoint mapping  $r : X \rightarrow Y$  which satisfies (1.1) and the inequality

$$|f(x) - r(x)| \leq \Psi(x, x, \dots, x)$$

for all  $x \in X$ .

*Proof.* Replacing  $(x_1, x_2, \dots, x_m)$  by  $(x, x, \dots, x)$  in (2.4) and multiplying by  $m$ , we obtain

$$(2.5) \quad |f(x) - mf(mx)| \leq m\psi(x, x, \dots, x).$$

Again replacing  $x$  by  $mx$  in (2.5) and multiplying  $m$  we get

$$|f(x) - m^2f(m^2x)| \leq m\psi(x, x, \dots, x) + m^2\psi(mx, mx, \dots, mx).$$

Again replacing  $x$  by  $mx$  in the above inequality and multiplying by  $m$  we get

$$|f(x) - m^3f(m^3x)| \leq \sum_{i=0}^2 m^{i+1}\psi(m^i x, \dots, m^i x).$$

Proceeding further and using induction on a positive integer  $n$ , we get

$$(2.6) \quad \begin{aligned} |f(x) - m^n f(m^n x)| &\leq \sum_{i=0}^{n-1} m^{i+1} \psi(m^i x, \dots, m^i x) \\ &\leq \sum_{i=0}^{\infty} m^{i+1} \psi(m^i x, \dots, m^i x) \end{aligned}$$

for all  $x \in X$ . In order to prove the convergence of the sequence  $\{m^n f(m^n x)\}$ , replacing  $x$  by  $m^p x$  in (2.6) and multiplying  $m^p$ , we find that for  $n > p > 0$

$$\begin{aligned} |m^p f(m^p x) - m^{n+p} f(m^{n+p} x)| &= m^p |f(m^p x) - m^n f(m^{n+p} x)| \\ &\leq \sum_{i=0}^{n-1} m^{p+i+1} \psi(m^{p+i} x, \dots, m^{p+i} x) \\ &\leq \sum_{i=p}^{\infty} m^{i+1} \psi(m^i x, \dots, m^i x). \end{aligned}$$

Allow  $p \rightarrow \infty$ , the right-hand side of the above inequality tends to 0. Thus the sequence  $\{m^n f(m^n x)\}$  is a Cauchy sequence. Thus we may define a mapping  $r : X \rightarrow Y$  by

$$r(x) := \lim_{n \rightarrow \infty} m^n f(m^n x)$$

for all  $x \in X$ . By (2.6) with  $n \rightarrow \infty$ , we have

$$|f(x) - r(x)| \leq \Psi(x, x, \dots, x)$$

for all  $x \in X$ . Replacing  $(x_1, x_2, \dots, x_m)$  by  $(m^n x_1, m^n x_2, \dots, m^n x_m)$  in (2.4) and multiplying by  $m^n$  we obtain

$$\begin{aligned} m^n & \left| f\left(m^n \left(\frac{\sum_{i=1}^m x_i}{m}\right)\right) - f\left(m^n \left(\sum_{i=1}^m x_i\right)\right) - \frac{(m-1) \prod_{i=1}^m f(m^n x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} f(m^n x_k)} \right| \\ & \leq \frac{1}{m} m^{n+1} \psi(m^n x_1, m^n x_2, \dots, m^n x_m) \end{aligned}$$

for all  $x_1, x_2, \dots, x_m \in X$ . Since  $\Psi(x_1, x_2, \dots, x_m)$  is finite, letting  $n \rightarrow \infty$ , we have

$$r\left(\frac{\sum_{i=1}^m x_i}{m}\right) - r\left(\sum_{i=1}^m x_i\right) = \frac{(m-1) \prod_{i=1}^m r(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} r(x_k)}$$

for all  $x_1, x_2, \dots, x_m \in X$ . Now let  $s : X \rightarrow Y$  be another function which satisfies the equation (1.1) and  $|f(x) - s(x)| \leq \Psi(x, x, \dots, x)$  for all  $x \in X$ . Since  $s(m^n x) = \frac{1}{m^n} s(x)$  and  $r(m^n x) = \frac{1}{m^n} r(x)$ , we have

$$\begin{aligned} |s(x) - r(x)| &= m^n |s(m^n x) - r(m^n x)| \\ &\leq m^n (|s(m^n x) - f(m^n x)| + |f(m^n x) - r(m^n x)|) \\ &\leq 2 \sum_{i=0}^{\infty} m^{n+i+1} \psi(m^{n+i} x, m^{n+i} x, \dots, m^{n+i} x) \end{aligned}$$

for all  $x \in X$ . Allowing  $n \rightarrow \infty$  in the above inequality, we find that  $r$  is unique. This completes the proof of the theorem.  $\square$

**THEOREM 2.4.** *Let  $X$  and  $Y$  be spaces of non-zero real numbers and  $2 \leq m \in \mathbb{N}$ . Assume that  $f : X \rightarrow Y$  satisfies the functional inequality*

$$(2.7) \quad \left| f\left(\frac{\sum_{i=1}^m x_i}{m}\right) + f\left(\sum_{i=1}^m x_i\right) - \frac{(m+1) \prod_{i=1}^m f(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} f(x_k)} \right| \leq \phi(x_1, x_2, \dots, x_m)$$

for all  $x_1, x_2, \dots, x_m \in X$ , where  $\phi : X^m \rightarrow Y$  is a function such that

$$\Phi(x_1, x_2, \dots, x_m) := \sum_{i=0}^{\infty} \frac{1}{m^i} \phi\left(\frac{x_1}{m^{i+1}}, \frac{x_2}{m^{i+1}}, \dots, \frac{x_m}{m^{i+1}}\right) < \infty.$$

Then there exists a unique reciprocal adjoint mapping  $r : X \rightarrow Y$  which satisfies (1.2) and

$$|f(x) - r(x)| \leq \Phi(x, x, \dots, x)$$

for all  $x \in X$ .

*Proof.* Replacing  $(x_1, x_2, \dots, x_m)$  by  $(\frac{x}{m}, \frac{x}{m}, \dots, \frac{x}{m})$  in (2.7), we obtain

$$\left| \frac{1}{m} f\left(\frac{x}{m}\right) - f(x) \right| \leq \phi\left(\frac{x}{m}, \frac{x}{m}, \dots, \frac{x}{m}\right),$$

which states nothing else but (2.2) in Theorem 1. Hence, by the same method of proof in Theorem 1, the proof of Theorem is completed.  $\square$

**COROLLARY 2.5.** *Let  $X$  and  $Y$  be spaces of non-zero real numbers and  $2 \leq m \in \mathbb{N}$ . Assume that  $f : X \rightarrow Y$  satisfies the functional inequality*

$$\left| f\left(\frac{\sum_{i=1}^m x_i}{m}\right) + f\left(\sum_{i=1}^m x_i\right) - \frac{(m+1) \prod_{i=1}^m f(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} f(x_k)} \right| \leq \delta$$

for all  $x_1, x_2, \dots, x_m \in X$ . Then there exists a unique reciprocal adjoint mapping  $r : X \rightarrow Y$  which satisfies (1.2) and

$$|f(x) - r(x)| \leq \frac{m}{m-1} \delta$$

for all  $x \in X$ .

**THEOREM 2.6.** *Let  $X$  and  $Y$  be spaces of non-zero real numbers and  $2 \leq m \in \mathbb{N}$ . Assume that  $f : X \rightarrow Y$  satisfies the functional inequality*

$$(2.8) \quad \left| f\left(\frac{\sum_{i=1}^m x_i}{m}\right) + f\left(\sum_{i=1}^m x_i\right) - \frac{(m+1) \prod_{i=1}^m f(x_i)}{\sum_{i=1}^m \prod_{k \neq i, 1 \leq k \leq m} f(x_k)} \right| \leq \psi(x_1, x_2, \dots, x_m)$$

for all  $x_1, x_2, \dots, x_m \in X$ , where  $\psi : X^m \rightarrow Y$  is a function such that for all  $x_1, x_2, \dots, x_m \in X$

$$\Psi(x_1, x_2, \dots, x_m) := \sum_{i=0}^{\infty} m^{i+1} \psi(m^i x_1, m^i x_2, \dots, m^i x_m) < \infty.$$

Then there exists a unique reciprocal adjoint mapping  $r : X \rightarrow Y$  which satisfies (1.2) and the inequality

$$|f(x) - r(x)| \leq \Psi(x, x, \dots, x)$$

for all  $x \in X$ .

*Proof.* Replacing  $(x_1, x_2, \dots, x_m)$  by  $(x, x, \dots, x)$  in (2.8) and multiplying  $m$ , we obtain

$$|f(x) - mf(mx)| \leq m\psi(x, x, \dots, x).$$

By the same method of proof in Theorem 2, we complete the proof.  $\square$
